

INCIDENT TWIN · HOW IT WORKS

One live incident, not 300 separate calls

When call volume spikes, Incident Twin groups every report from 911, 311, web forms and responder radio into one live picture of each incident: where it is, how it's moving, and whether it's getting worse. Front-line staff can flag a grouping but never finalize it. A dispatch supervisor reviews every grouping across the floor and makes the final call before units go out from CAD.

01

Ingest

Every report, transcribed live while the call is still going.

- 911 voice (baseline)
- 311, tip line, web forms
- Responder radio updates

02

Categorize

Link each report to an incident, using place, time, path and details.

- Duplicate · Update
- Consequence · Separate

03

Prioritize

Rank incidents, not calls. Feeds existing priority codes.

- Severity trend
- Call volume spike
- New urgent detail

04

Visualize

Show the incident. Hide the calls until someone asks.

- Footprints on a map

- Alerts on change only

05

Escalate & decide

Every grouping goes up to the dispatch supervisor, who sees all incidents at once and makes the final call.

- Approve, split or send back
- Front line flags, never finalizes
- Then units go out in CAD

EVERY NEW REPORT GETS ONE OF FOUR LABELS

Duplicate

Same incident, nothing new

Filed under the incident. Call count goes up.

40th call: "car on fire"

Update

Same incident, new detail

Changes the incident's footprint, severity or needs.

"Fire spread next door"

Consequence

New incident caused by this one

Its own ticket, linked to the parent. May need its own unit.

Second fight down the block

Separate

Unrelated, close by chance

Its own ticket, never merged. Ranked on its own.

Heart attack 2 blocks away

ONE INCIDENT OVER 12 MINUTES · STOLEN CAR, UPPER WEST SIDE

11:02 PM · 9 calls, 6 blocks
